

Review of: "The Ancient Indian Knowledge System and the Medical Sciences"

Sabyasachi Banerjee

Potential competing interests: No potential competing interests to declare.

The topic seems to be interesting enough. This article was supposed to give a short look at the Indian system of medicine, Ayurveda. However, the ideas given aren't very deep, which makes the paper seem less real. There are also a few grammatical mistakes in this. The title is vast, and the topic of ancient Indian remedies is very broad. This document is a compilation of data extracted from reported documents. The article must include the method of literature searching, the keywords used during search, the chosen databases. The information requires a systematic organization and an insightful literature review. The article discusses how important healing plants were in old Indian medicine and how they are still important in modern medicine. Therefore, few more data need to be incorporated in this article.
