The research question is very interesting and crucial. It is a precise application of environmental psychology in architecture. Studying space requirements for safer design and less crime probability is an impressive topic.

The findings are direct and suggestive of some on-ground solutions.

However, the conclusion lacks thorough findings' analysis. As some significance of factors could have been statistically tested for more reliability of the results.

The structure of the article is a bit confusing, and the method is alternating between different theoretical analyses and reviews and different surveys' analyses, which leads to confusion.

Overall, the article is interesting; more structure and deeper findings' analysis might be required.
