Thank you for providing me opportunity to review the paper. Authors did a lot of work to make a point. I appreciate authors and their mentors. I would like to suggest that authors carefully review the grammatical and typo errors in the manuscript. Prevalence of TTI should be given in pie graph using data from each diseases. In table 1, authors have associated age with prevalence of TTIs, there are not many participants in age group 51-60 and 61-65, so I would like to suggest that authors should remove data of people aged with age ranging from 51-65 y and then analyze the data. It is interesting to note that females are more hesitant to donate the blood in Cameroon (case stand similar with Low income countries) what are reasons of blood donation hesitancy among females needs to be spelled out in discussion section. My best wishes
