Potential competing interests: No potential competing interests to declare.

In this manuscript the author has proposed a new partition theory to explain the standard quantum mechanics. The author explained the all aspects of quantum mechanics very nicely by the partition theory. I am totally convinced by the author's approach. I have few non technical suggestions in my mind, which are followings,

1. The author should take care the language of literature, english can be improved.
2. The representation of this manuscript seems to me little bit poor, I think there is plenty rooms to improve the representation that will help to increasing the readability and make the article more easy to understand.
3. The author should be more clear regarding the importance of the result or the approach, the scope of future work and how this work can help the community.

I am requesting to the author to take in counter these few minor suggestions.
