Atrial standstill

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Atrial standstill. ORPHA:1344*

Atrial standstill is a rare cardiac rhythm disease with a few familial and sporadic cases described to date that is characterized by a transient or permanent absence of electrical and mechanical atrial activity. Electrocardiographic findings include bradycardia, ectopic supraventricular rhythms, lack of atrial excitability and absent P waves.
