

Review of: "Adoption of Technology Acceptance and Interfaces for Academic Information System Applications"

Dekeng Setyo Budiarto

Potential competing interests: No potential competing interests to declare.

1. Much research has been employed using TAM theory; are there any empirical differences with previous research?
2. I need help finding the motivation for research.
3. In my opinion, there still needs to be a lot of improvement so that the manuscript fits the structure of an empirical research manuscript (this manuscript is still like a summary of a research report)
4. To test validity, why do you still use r-count?
5. Why is there no variable measurement?
6. Multiple tables can be combined (tables 3, 4, 5)
7. Why do you still employ classical assumption tests if you use a questionnaire?
8. What are the reasons for using students of the Health Polytechnic of Malang City?
9. The numbers in the table do not need to be rewritten in the paragraph.
10. Why are there no empirical limitations and suggestions for further research?
