I read the paper and I think the authors tried to present the erosion situation in Cesar

Watershed temporally and spatially. I have some suggestion to increase the quality of the paper.

1. The authors should present which parameters cause the difference erosion rate in different period and compare the values in the separated table
2. This type of the manuscript with respect to the previous researches require a specific novelty and it must highlight in the manuscript.
3. The validation of the results is not clear in the text. I suggest to present the sediment yield rate and discharge in different periods in the separated tables
4. Using Getis-Ord tool for taking hotspot and cold spot for the erosion is not clear in the text
5. Table 3 is not clear and the authors should explain the accuracy of different SDR with statistical index
6. The vertical axis of Fig.3 is not clear and points on this figure have some mistakes
7. The authors generally talk about Cesar River Restoration without any facts. I think this part should be strengthen
