**Potential competing interests:** No potential competing interests to declare.

The narrative review on the forensic implications of temporal lobe epilepsy (TLE) you've outlined seems comprehensive and insightful, covering a broad spectrum of topics relevant to the intersection of neurology, law, and psychiatry. However, there are several areas where the review could potentially be improved or where it might face criticism: While the summary provides a broad overview, it may benefit from a clearer structure and more defined sections. The transition from discussing the clinical aspects of TLE to its forensic implications could be made smoother by introducing subheadings or explicitly delineating parts of the discussion to guide the reader more effectively through the complexities of the subject. The review also mentions the forensic implications such as legal responsibility and the association with criminal behavior, but it could deepen its analysis by including specific case studies or recent legal precedents that illustrate these issues. This would not only provide concrete examples but also enhance the practical relevance of the review. While the review underscores the need for further research, it could be more specific about the areas where research is lacking. Providing targeted recommendations for future studies or highlighting emerging technologies and their potential impact on the field could be very beneficial.
