

# Review of: "Glycemic Control and Its Determinants Among Type 2 Diabetes Mellitus Patients at the Limbe Regional Hospital, Limbe, Southwestern Cameroon"

Prabha Thangaraj

Potential competing interests: No potential competing interests to declare.

Study has been well written with clarity of content. The results and discussion is also precise and relevant.

Following are some suggestions

1. Authors could mention the scale used to measure medication and dietary adherence.
2. Need for study could be improved by stating the benefits or action plan that will be taken based on study findings.
3. The study mention that those aged between 40 to 49 need more health education since they have poor control of sugar. But this calls for health education among patients in age group 30 to 39 who will be entering their 40s soon. There is also possibility of more stress is age group that can contribute to poor adherence.
