Dear Editor and Authors,

This study indicated the Sex Ratio, Spawning Cycle, and Size at Maturity of Bluespotted Seabream *Pagrus caeruleostictus*, Val 1987) from the Coast of Ghana. Although the study is important, there are some important shortcomings.

Especially, the purpose of the study is not well expressed, and what it does not aim for is not stated in the introduction of the paper. Additionally, the results in the discussion section are not described well enough regarding their contribution to science.

Other minor corrections are indicated on the manuscript as sticky notes.

Suggested corrections:

Title should be revised as "Sex Ratio, Spawning Cycle, and Size at Maturity of Bluespotted Seabream *Pagrus caeruleostictus*, Valenciennes 1987) from the Coast of Ghana"

Running title should be edited as "Reproductive Biology of Bluespotted Seabream in Ghana"

Sex ratio must be corrected to "female:male 1:0.43"

References should be re-revised according to the journal style.

The paper can be accepted by me after the suggested corrections and indicated changes.

Best regards,
