

# Review of: "Targeting Cancer Cell Signaling Using Precision Oncology Towards a Holistic Approach to Cancer Therapeutics"

Ankit Kumar Dubey

Potential competing interests: No potential competing interests to declare.

The article presents an intriguing exploration of the potential of precision oncology in cancer therapeutics. The author has made commendable efforts to discuss the holistic approach to targeting cancer cell signaling. However, there are several areas that require attention and improvement before the article can be considered for publication:

1. The article's title suggests a holistic approach to cancer therapeutics, but the content focuses primarily on precision oncology. The scope of the article needs to be clarified to match the title.
2. The introduction should provide a more comprehensive background on cancer cell signaling and the significance of precision oncology. It should clearly articulate the gaps in current therapies that precision oncology aims to address.
3. The article lacks a clear and logical flow. It would greatly benefit from better organization, with distinct sections for the introduction, methods, results, discussion, and conclusion.
4. Incorporate specific clinical examples or case studies to illustrate how precision oncology has been applied successfully in cancer treatment. This would make the article more engaging and relatable to clinicians and researchers.
5. The concept of a holistic approach to cancer therapeutics is mentioned in the title, but it is not adequately explored in the content. The article should discuss how precision oncology fits into a broader holistic framework for cancer treatment.
6. Ensure that all claims and statements are properly supported by relevant citations. Additionally, the references should be updated to include recent studies and developments in precision oncology.
7. The conclusion should summarize the key findings and implications of the research presented. It should also offer insights into future directions for precision oncology research and its role in holistic cancer treatment.
8. The article contains some grammatical errors and awkward phrasing. Careful proofreading and editing are necessary to improve clarity and readability.
9. Clarify the target audience of the article. Is it intended for researchers, clinicians, or a broader audience? Tailor the content and terminology accordingly.
10. Discuss ethical considerations related to precision oncology, such as patient consent, data privacy, and potential disparities in access to advanced treatments.

In summary, the article has potential but requires substantial revisions to align the content with the title, improve organization, provide more in-depth information, and clarify the holistic approach to cancer therapeutics. Addressing these

comments will enhance the overall quality and impact of the article.
