

Review of: "Neutronic Chain Reactions for Polonium-210 Production"

Anwen Page

Potential competing interests: No potential competing interests to declare.

This article is well-written and has a detailed characterisation of the nuclear reaction with multiple methods of validation like alpha and beta spectrometry. The findings of the paper also have many implications for the production of polonium-210 in nuclear reactors, as conventional nuclear reactors would no longer be required to produce it. The author must be congratulated for his efforts.
