**Potential competing interests:** No potential competing interests to declare.

The paper deals with a topic of great interest. However, I have some concerns about the methodology used in the study.

The author states that the goal of the study was to examine the effects of online learning on students' mental health. However, the methodology used in the study does not seem to be adequate to achieve this goal. The author used a survey of 21 questions to collect data from students, but it is not clear how these questions were selected and only two of them are reported and discussed in the results. Additionally, the author did not provide any information about the sample size or the sample characteristics. This makes it difficult to determine the generalizability of the results.

The author also states that the study used a statistical method to analyse the data. However, no information is provided about the statistical method that was used. This makes it difficult to evaluate the results of the study.

The findings and recommendations are comparable to those of earlier studies, making it difficult to determine new evidence produced by the study.

Finally, the author does not cite any sources in the paper. This makes it difficult to verify the author's claims.

Overall, I think the paper has some potential, but I have some concerns about the methodology and the lack of citations. I would recommend that the author revise the paper to strongly address these concerns.
