## Comments by Dr. Tahseen Kazmi

**Abstract:** Needs to be modified. I have suggested changes in the manuscript. Add a heading of background with information about the prevalence of anemia among under-five children globally and in Nigeria and its health implications.

## Methods Section:

**Study Design:** Cross-sectional study based on data from the Demographic and Health Survey (DHS, 2021).

**The Statistical analysis** section has too much unnecessary detail about tests.

**Study variables** with definitions and cutoff points of anemia should be mentioned.

**Discussion Section needs** major revision with comparison of main results with other similar studies.

**References:** For such a large dataset, there should be at least 20-25 references in this study.
