In this paper, the issue of Non-Revenue Water (NRW) and the importance of using SCADA (Supervisory Control and Data Acquisition) to reduce NRW and improve water system management are considered.

The abstract section is well-written, and a methodology for the creation of counter zones and the SCADA application is reported. The comparison between the total water production for western Isna in the months of April and May of the years 2021 and 2022 is also shown.

The article is clear and well-written but lacks a consistent bibliographic review.

Moreover, in the conclusion section, I suggest a wider amount of data to be considered, and an explanation of the causes which lead to the total water reduction is also missing.
