Potential competing interests: No potential competing interests to declare.

The article highlights the milestones of prof. Carraro's research in a scientifically sound, nonetheless affectionate fashion. Many of his papers became "classics", still valid today, and this is an interesting point: innovative ideas supported by good experimental evidence never age and are always valid and valuable. In addition, while reading prof. Carraro's biography one can perceive the importance of thinking out of the box. Having heretical ideas is of great help for science and helps keeping the debate open and evolving. I recommend the reading of the this article to both young folks and established researcher. Prof. Carraro's career is really inspirational.
