# Heart-hand syndrome type 3

INSERM

## Source

*INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Heart-hand syndrome type 3. ORPHA:1342*

Heart-hand syndrome type 3 is a very rare heart-hand syndrome (see this term), described in three members of a Spanish family to date, which is characterized by a cardiac conduction defect (sick sinus, bundle-branch block) and brachydactyly, resembling brachydactyly type C of the hands (see this term), affecting principally the middle phalanges in conjunction with an extra ossicle on the proximal phalanx of both index fingers. Feet abnormalities are more subtle.
