

# Review of: "Neurotherapeutic Comparison of Aripiprazole and Ethanolic Extract of *Fragaria Ananassa* on Cerebrum and Amygdala of Methamphetamine Intoxicated Male Wistar Rats"

Hamna Rafiq

Potential competing interests: No potential competing interests to declare.

It is an interesting work, but some points are important to mention:

1. The possible mechanism of action of *Fragaria ananassa* by which it is helpful to mitigate behavioral disturbances and oxidative stress.
2. The justification for using aripiprazole in comparison to the extract.
3. The name of the cerebrum and amygdala in the title and the description of these regions in the introduction is not relevant.
4. The procedure of extraction is not well-defined.
5. The overall manuscript needs an extensive literature search and explanations in all sections.
