Dear authors,

Your manuscript, entitled: "Ecological diversity, structure and exploitation of rattan stands according to a disturbance gradient around the Nkoltang forest, Estuary province of Gabon," has been carefully reviewed. In my opinion, the manuscript will be of interest to the audience of QEIOS. The argument is interesting, but it has to be improved. The introduction has to be better presented. Data analysis must be cited in tables and figures. Results have to be better discussed. See others' observations in the paper. I suggest a major revision.

Sincerely,
