Potential competing interests: No potential competing interests to declare.

This study is specifically helpful for developing Zimbabwe's National Spatial Data Infrastructure (NSDI). The article is structured and easy to understand. Several things need to be added to improve the quality of this study:

1. In the abstract section, there needs to be a conclusion from this research in more depth.
2. In sub-chapter 4. Development of the e-Government Infrastructures, I suggest explaining the method used more clearly. Writers can arrange it as a flow diagram or, if necessary, present a spatial formula.
3. To improve the quality of the discussion, my suggestion in sub-chapter 5. SDI for e-government based on Geospatial Services is to compare with previous research, which can support or oppose.

We wish you more success in technological development in Zimbabwe.
