I found the article an interesting read. However, here are some of my comments

1. If you adapted an original scale, you need to state a few examples of the same within your write up in the methods section
2. Instead of using the term pre-tested, use the term pilot tested the tools
3. The use of the word variable is very confusing!! Are you trying to say, there were different subscale on competencies that were being utilized within your study?
4. I only see a general aim of the study. You need specific research questions as well.
5. Instead of highest proportion use the term majority in your write up
