The manuscript study "**The anti-staphylococcal activity of probiotic-contain gelatin and whey coatings on processed chicken breast**" is interesting, and the information provided is interesting. Below are some points which should be addressed in order to move on:

Note: some typos, spelling errors, and overall language need to be corrected and proofread.

Abstract:

-The authors should reorganize as follows: (Problem of research, aim of study, remarkable results, and significance of study).

The objectives and variables of the study have not been specified.

It is suggested to report the most important destructive challenges as well as the achievements of this study.

The necessity and innovation of this study are not clear!

It is better to provide more data in the abstract (key results).

It is suggested to express the potential applications of this study.

What was the main objective of this study?

Which is the optimal sample or formulation? It is better to specify in the abstract.

-Introduction does not fully show the background (include characteristics, current situation of development, research status, and problems encountered) and purpose of the review. Please rewrite the introduction.

Abbreviations should be defined in the text and figures.

-The quality of the figures is low.

Statistical analysis letters should be specified in figures and tables.

- It is necessary to compare the results with other studies in each section of results.

- It is necessary to mention the possible reasons for each obtained result.
- The discussion needs further improvements as well. Especially compare the results in this study with the most recent related literature and do a critical evaluation of the trends/similarities/differences
- Conclusions: The authors should write this section in a comprehensive and suitable style.
- The authors should indicate future research recommendations.
- Main drawbacks and limitations of the study should be indicated.
