This Case has already been published : Martin BR. Supplementation with Vitamin D, Zinc, and Quercetin to treat COVID-19: A Case Report. *Austin J Clin Immunol.* 2023; 9(2): 1055.

As major general comments, this case report lacks fundamental information, such as intra-vaccine times, does not mention the exact time since the last vaccine, lacks molecular diagnosis to support clinical diagnosis, which would also have allowed monitoring viral load and even the viral strain. Additionally, the improvement in reported symptoms is subjective and is not supported by biochemical or quantitative markers.
