# Genetic hyperferritinemia without iron overload

INSERM

## Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Genetic hyperferritinemia without iron overload. ORPHA:254704*

Genetic hyperferritinemia without iron overload is a rare biological anomaly defined as high serum ferritin levels without elevations of transferrin saturation, tissue or serum iron and characterized by an apparently asymptomatic clinical phenotype.
