Potential competing interests: No potential competing interests to declare.

I found this manuscript very interesting with results of some importance for the community interested in these problems. To allow a wider dissemination of these results, I would suggest commenting a little more in detail on the initial equations that define the problem. Furthermore, it seems to me that the results shown in Figs. 7, 8, 9 are not entirely consistent with what is stated in the text regarding the effects observed at two different wavelengths.
