Potential competing interests: No potential competing interests to declare.

The author can bring the complex idea of how the society use green spaces with many variables and attempts to explain the phenomena happening in green spaces. The ide of using geographical features, physical excercise, neighbourhood diversity, and single status in these contexts will bring a new insight for urban planner perspective in designing green spaces.

Therefore, there are some aspects that i want highlight:

1. In introduction, there are a lot of reference and the author did not focus on those variables. Please do not include any references that is not related to the main topic to make coherency in esch paragraph.
2. I got lost when i read the result and the discussion. In table 1, there are yes and no, bu i forgot about the categories and i had to jump into previous section. It is better if the author provide some information about the categories (in a brackets) to make sure the reader understand what the author want to explain. Meanwhile, in table 3, there are no category of vehicles (yes or no), instead the author provides all vehicles and its correlation with other variables.
3. In discussion, the author provides too many data and i could not follow the data with author's interpretation. I hope the suthor will make it simple and provide only important data for this article.
4. Overall, The article is so great and i know how passionate the author about green spaces. Thank you for letting me review your article.
