The mini review "Inhibiting Efflux Pumps and Resistance Mechanisms"

describes the role of the Efflux pumps in the development and spread of antibiotic resistance among bacteria.

The manuscript describes an important and interesting topic, I consider that the manuscript has not the conditions to be published in the journal.

The manuscript has not the enough number of references for a minireview

The depth of the text is not adequate, leaving the information incomplete or superficial.

The section "Types and Functions of Efflux Pumps" says "Efflux pumps come in different shapes, sizes, and flavors. Okay, maybe not flavors, but you get the point. There are several types of efflux pumps, each with its own specific function[4]. Some pumps specialize in pumping out certain antibiotics...." and is inespecific

The section "Mechanisms of Antibiotic Resistance" is very general

All topics and sections are short and inespecific.

The review does not contain tables or figures to resume and understand better the topic
