The paper 'A Review of the Scientific Literature on Experimental Toxicity Studies of COVID-19 Vaccines, with Special Attention to Publications in Specific Toxicology Journals' lists several toxicological articles concerning the safety of COVID-19 vaccines. In particular, the author wonders why a relatively scarce amount of animal studies has been published on this topic and none by vaccine-producing companies. In general, the paper is well-written, and the review is accurate and detailed. In my opinion, due to the relevance of the topic, the conclusions should analyze in depth the reasons and provide hypotheses.
