Potential competing interests: No potential competing interests to declare.

In this article, a new approach to melon cultivation is discussed. This can be considered entrepreneurship, and commercial production can be done by obtaining legal permits in this way, but the results are insufficient; it is unclear whether the study is research or a report. More evidence and research based on valid statistical methods should be done. The literature is insufficient; it is understood that there is not much literature review on the subject. In addition to all these, the term "aquaponics," given in the title, should include the plant-fish ecosystem, but there is no mention of the fish grown in the study, their type, or number. It is not known what kind of feed was used. This study can be used as a report rather than a study that can be published in a refereed journal. It is not possible to publish the study as such.
