**Potential competing interests:** No potential competing interests to declare.

I am glad that I was able to review the manuscript "Medical students' disease status of COVID-19: A multicenter study".

I appreciate the effort, though:

**Abstract:**

1. Mention that 605 medical students from Khyber Pakhtunkhwa province answered the questionnaire. In fact, how many medical students (clinical and preclinical) are there in total in this region?

2. What is KPC?

**Introduction:**

1. The objectives are not well highlighted

2. I think that references should have been made to the results obtained from other countries, from other continents

**Material and methods**

1. The study took place over a period of 6 months. But in the Discussions chapter you say that in the period June 2021-March 2022, which means 10 months

2. What are MBBS and BDS?

3. You state in the text that a questionnaire developed by them was used: by whom? Was it a validated questionnaire?

How many questions did it have? It would have been good to be additionally attached to the text.

4. What are the inclusion and exclusion criteria in the study?

5. How did you analyze statistically? What was the working sample?

**Discussions**

It is a good study that would require comparing the results obtained with other studies from other countries.

**Conclusions**

Please explain what multicentric sampling means, which you don't say anything about in the text until the conclusions

**References:** 24 from the last 5 years
