Potential competing interests: No potential competing interests to declare.

The article addresses some specific instances when either excessive or under diagnosis of thyroid cancer have occurred. It informs on the updated pathological variations of thyroid malignancies. However, even as a short communication, there needs to be a conclusive statement. Authors should suggest what the scientific community (pathologists, ENT surgeons, researchers etc) should do in order for the stated problem to be solved. For example, suggest new research areas or diagnostic protocols or training programs

In addition, authors should adjust minor errors related to english accuracy.

1. The statement below is incomplete: "To promote the transformation of pathological classification from microscopic observation to genetics, and the treatment mode from one-size-fits-all to risk stratification, by understanding the natural development, biological characteristics, the progress, and prognostic risk factors of thyroid cancer. Did authors mean to say "Our objective was to...."? Please reformulate for more clarity.
2. "Due to the misdiagnosis, the patient was only undergone local operation, which led to undertreatment". This statement should be reformulated for more clarity.

Otherwise, the authors have addressed a relatively rare research domain and should be commended for that.

Best regards.
