Manuscript entitled "Development and Functionality of the BC Tool (Automated Boolean Composer) to Simplify and Standardize Search Strategy Construction in Bibliographic Databases" is aimed to describe "the development and functionality of the Automated Boolean Composer (ABC) Tool, an automated strategy generator integrated into the advanced search interfaces of Epistemonikos's bibliographic databases".

This new tool could be useful even for experienced researchers while developing search strategies. I did not find information regarding any features to perform the line-by-line analysis necessary to fully validate a search strategy. I think this would be useful too.
