# Quipazine Maleate

National Cancer Institute

## Source

National Cancer Institute. *Quipazine Maleate*. NCI Thesaurus. Code C66502.

The maleate salt form of quipazine, a piperazine-based nonselective serotonin (5-HT) receptor agonist with antidepressant and oxytocic activities. Quipazine targets and binds to serotonin receptors, particularly to the 5HT<sub>2A</sub> and 5HT<sub>3</sub> receptors. Serotonin receptor activation by quipazine may lead to smooth muscle contraction and antidepressant effects.
