A very good study on a very important issue affecting women following (or while undergoing) treatment for their cervical cancer. Just a few comments/suggestions from me:

1. The duration of radiotherapy that the patients had - when was the recruitment took place? At 0 weeks before the radiotherapy or during the radiotherapy? If later, when was the exact time? Is there any difference according to the duration (number of weeks) of the radiotherapy?
2. Ideally, a case-control study would be a better design, as you would clearly show that the improvement was directly related to the PFM exercise and not to many other reasons. Please discuss this under study limitations.

Well done!
