The manuscript was good in its language, the abstract gave all suitable information that was important in the manuscript, the structure was good, and the manuscript was correctly subdivided into many subdivisions such as risk of virus transmission and diagnosis. The strength of the manuscript is that it provides all suitable information required about the virus.

All figures and tables were suitable and indicative. The section on Risks of COVID-19 (SARS-COV-2) in Pets was indicative, and as a review article, the information included in this manuscript provides a good conclusion. For more improvement of the manuscript, I suggest the isolation of the virus from pet animals to give a clear vision about the transmission of the virus between pets and their owners.

The structure was strong enough and no need to be strengthened more, and no additional information about virus transmission between pets and humans was needed.
