

Review of: "Larache's Coastal in Morocco: Evaluating Dredging's Impact on Fisheries and Shoreline evolution"

Samir Nasr

Potential competing interests: No potential competing interests to declare.

Thank you for inviting me to review the manuscript that has been submitted to Qeios. I have read the article entitled **"Larache's Coastal in Morocco: Evaluating Dredging's Impact on Fisheries and Shoreline Evolution."**

Following are some comments that the authors may consider addressing to enhance the text:

- Clarify the Research Methodology: The authors should provide a detailed description of the research methodology, including the sampling techniques and data collection methods.
- Use of Google Earth is insufficient; there are satellite images (Land Sat) which may be more appropriate to carry out a comparative analysis of the images.
- The methodology of the manuscript is not suitable to show the effect of dredging on fisheries.
- I knew the aim of the work in the conclusion only.

From my point of view, I regard this work as a report and not a scientific paper of well-known basic requirements.
