Potential competing interests: No potential competing interests to declare.

The authors have claimed to discover the potential for metadichol to induce CD14 Glycoprotein Expression in Human Embryonic Stem Cells and Fibroblasts. Most of the results are presented without clear information on the number of independent experiments done and the statistical tests used. This is not acceptable in publishing data as it does not meet scientific merit.

Authors are suggested to perform and report all the experiments in sufficient independent experiments to validate the results. A statistical test that is suitable is needed to verify if the findings are significant.
