This is an interesting paper on different types of biases existing in clinical trials with a reference of type 2 diabetes trials. The authors rightly pointed out the uncontrolled biases and provided some of the [possible solutions to overcome them. The article can be improved by:

- Providing a bit more detail on methodology
- What are the key outcomes that the study is talking about?
- How was the ORs calculated? Did all the trials report OR? How about IR/RR?
- Which data analysis software was used?
- A reflective paragraph on discussion of the findings and the limitation of this study itself.
