**Potential competing interests:** No potential competing interests to declare.

The production and study of sustainable packaging that replaces plastics is very important for the food chain and the environment. It is important to study new materials, especially those that are abundant in nature, such as algae and their mixture with other polysaccharides, that can improve the film-forming properties and coatings. The article is well written and argued. The methodology has been well described and is reproducible. All the results have been presented and discussed, and I believe there is no need to add any further information. Graphs clearly show the results found, and, finally, there is a well thought-out conclusion.
