The paper was very relevant in nature, especially, in this period where health issue is one of the great concern in every nation due to the ongoing pandemic. Some recommendations and/or suggestions were the following:

1. In the introduction, the discussion about the topic which is about the knowledge, attitude, and practice (KAP) of parents and service providers' perceptions on invalid vaccine doses were discussed very well. The background and the present condition in the locale were also tackled. However, consistency throughout the entire manuscript should be considered. For example, the number of sentences in stanza should be at least two. In the research questions stated that is enumerated in list or number form, it should be revised in paragraph/narrative form.
2. In the ethical consideration, state where the researchers obtain the permit or clearance to conduct the study.
3. For the result, replace or revise those statements that contain "we". Instead, use "the researchers". Improve the manner of presenting the data in tables. Create additional tables to separate those data that differ or require a different approach in presenting it. Also insert legend for the tables that contain acronyms.
4. In the discussion part, include discussions about the relationship between respondent's socio-demographic condition and vaccination status with supporting statements that will either support or contradict the result obtained.
