I enjoyed reading this paper and I have learned new information. The topic presented, add a level of **originality** which justifies publication. It combines four very important factors to examine creativity at times of society improvement. The paper seems to demonstrate an adequate understanding of the relevant **literature**. However, I believe that:

1. there is not much reference and comparison to similar **past research**.
2. it is not clear if there is **past research** on the subject
3. some of the **references** are outdated

Two kinds of research have been used, quantitative and qualitative, which is very useful and interesting. Results are clearly analyzed and interpreted. However, **implications** to the society are not clearly stated. Further discussion is required.
