Solitary necrotic nodule of the liver

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. *Solitary necrotic nodule of the liver*. ORPHA:100035

Solitary necrotic tumor of the liver is a rare nonmalignant hepatic lesion characterized by a mass with a completely necrotic core often partially calcified, surrounded by a dense hyalinized fibrous capsule containing elastin fibers. Patients are usually asymptomatic but some may suffer from intermittent abdominal pain or discomfort.
