As per the title and the abstract, this paper addresses a timely topic where simulation models are presented for almost every part of the EV powertrain. The models on different parts of the EV powertrains have been published elsewhere.

Therefore, it would be better to highlight the contribution of the authors. As I can see, one of the key contributions is to put together all EV powertrain component models together. Also it would be better to compare the models published elsewhere and highlight on the sensitivity of various parameters and the fidelity of the models.
