Potential competing interests: No potential competing interests to declare.

In this paper the very important topic about womens' entrepreneurship was covered. Authors used sample of 281 women entrepreneurs and applied simple statistics methods for results analysis. The objective and hypothesis are clearly presented. Maybe 6 hypotheses would be too many. Analysed factors are grouped and systematically approached. Limitations are named.

Some suggestions to improve:

Authors should supplement the literature review with more recent publications.

Covid period would be specificly interesting in this research if data would be available.

Descriptive statistics would also give more insight.

Recommendations:

Authors should consider taxonomy methods like Factor analysis to enrich their research with hidden factors.
