Potential competing interests: No potential competing interests to declare.

The authors provide an intriguing perspective on infusing agile methodologies into educational practices and techniques. It effectively emphasizes the growing need for schools and universities to adopt adaptive approaches to keep pace with the rapidly changing demands of the 21st-century learning environment. In particular, the authors highlight several key competencies that educators must cultivate to thrive within an agile model of teaching and learning.

Moreover, the Agile2Learn project is presented as an insightful example of how agile principles can be operationalized to empower educators in addressing modern challenges. However, it is important to note that the findings are drawn primarily from secondary sources, which may not fully capture the most current developments in the dynamically evolving fields of educational technology and pedagogy.
