Review of: "The Non-Reflexive Formulation of Quantum Mechanics: the Whys and the Hows"

Dr William Sulis¹

1. McMaster University, Canada

This is an interesting paper dealing with the issue of indiscernibles in quantum mechanics, and its treatment in formal logic. I found this to be a nicely written paper overall, apart from some minor issues of English usage. It provides an overview of the subject and a survey of results, especially those of the author.

I wonder if the author is aware of the book by A.F. Parker-Rhodes, "The Theory of Indiscernables". This author also approaches the problem from a logical perspective. If not, they might find it of interest.
