Potential competing interests: No potential competing interests to declare.

The paper makes a good attempt to explain how cloud computing can be leveraged to change the paradigms in academics.

However, it has been observed that a form of biased has been introduced in the work. For instance, the researcher(s) used an heading "Important Cloud Computing" and explain like three or so. Do other cloud computing platforms not important? The researcher(s) would have written "Some Cloud Computing."

Also, there are some grammatical inconsistencies in the paper. These are found in the Literature Review. I also have a reservation about the referencing style used for the paper.
