

Review of: "Clinical Implications of EMT in HNSCC: A Review of the Factors and Pathways at Play"

Roza Motavalli

Potential competing interests: No potential competing interests to declare.

[http://The review presents intriguing insights, and the discussion is articulated comprehensively. Below are suggested comments for improvement: - It is important to note that the immune system plays a significant role in epithelial-mesenchymal transition \(EMT\) in head and neck cancer \(HNC\). Please include relevant documentation on this topic. - Kindly revise the abbreviation in the title to its complete form. - A comprehensive figure illustrating the signaling pathways would greatly enhance the manuscript. - A critical evaluation of the studies should be considered. - Please incorporate specific recommendations for future research or clinical applications. - References should be carefully rechecked for accuracy. - The text requires a thorough review for English grammar, as well as revisions to enhance fluency and clarity in certain sentences.](#)
