Potential competing interests: No potential competing interests to declare.

The article touches on a current topic. A detailed analysis was made on the topic of the study.

The authors note the advantages of using cloud platforms in the educational process and offer a model of the relationship between users of the cloud service, as well as known threats and vulnerabilities.

The content of the article also touches on the use of modern technologies, including the use of machine learning.

However, we would like to point out the following:

Part IV mentions major cloud providers like Amazon, Microsoft, and Google. The content of the article contains an analysis about Amazon and Google. It would be desirable to reflect information about the benefits of Microsoft cloud services;

in our opinion, the article is written in a theoretical aspect, the content would benefit if some data on the practical part were given, as well as an example of the use of a specific virtual machine by the authors.

These comments do not affect the content of the article, we hope that they will be taken into account in the future.
