Review of: "Human Exposure to Arsenic and Toxic Metals Through Meat Consumption in Africa: A Review of Scientific Literature"

Galia Zamaratskaia¹

1. Swedish University of Agricultural Sciences, Sweden

This is a well-written article that addresses an important and timely topic: the exposure of Africa's population to arsenic and toxic metals through meat-based products. The study provides valuable insights and makes a significant contribution to the fields of food safety and public health. It consolidates existing knowledge and also provides a clear direction for future studies and policy development aimed at increasing food safety and public health across the African continent. However, the conclusion is currently somewhat lengthy and discusses background information that might be better placed earlier in the text. A more concise conclusion highlighting the main outcomes, such as the identification of high-risk regions, tissues, and populations, will increase the clarity and impact of the final message.
